COMP1200-C - Assign 08
Due midnight – Thursday – April 9, 2015
Submit `assign08.c` **via Canvas**

NOTE:
Your submitted file(s) **MUST** be
spelled and cased as instructed.
[-5 points for not doing so.]

Before you start writing your program:

Read these instructions carefully. A development plan is a process that guides you through solving a problem and creating an algorithm. Download the `2015_AU_softball.txt` data file from the [assign08 Announcement](#) and save in your `COMP1200/assign08` folder. If you do not have folders set up for your assignment files, this is a good time to start. `assign08.m` will look in the folder where it is saved for the data file. A development plan is a process that guides you through solving a problem and creating an algorithm. Create your own algorithm and use it as comments throughout your program. Use section comments to group your statements as well as comments from your algorithm.

Problem:

Program: assign08.c

The 2015 Auburn softball team is having a great season. In this assignment, you will read some game result from `2015_AU_softball.txt` and print and graph a summary of the data. The season is not over; you do not know how many games are in the file. The following information is in `2015_AU_softball.txt` for each game of the season:

Game	AU	Opp	no.	Attend	Game length
Code	r-h-e*	r-h-e*	innings		hr : min
x	15-13-1	5-5-1	5	845	2:15
@	11-13-1	2-5-0	5	967	1:44

*r-h-e = runs-hits-errors

Using the `fscanf` function, you will store **ONLY** the following information into 1D integer arrays: game code, Auburn runs scored, Auburn runs allowed (Opp runs), number of innings, and attendance. All other values are “skipped” using “hold” variables. See the `skipData.c` example on Canvas.

The printed summary should contain the number of games, minimum, mean, and maximum runs scored and allowed for all games and for SEC games. The game code for SEC games is an asterisk, *.

Use the following user-defined functions to perform the described tasks. The program structure diagram provides a guide to the relationship of the functions and the information passed to and from the functions.

// FUNCTION PROTOTYPES=====

```
int getFileData( char code[], int auRuns[], int oppRuns[], int innings[], int attend[] );
```

Function opens and read the data file. Because code, a char, is the first for each game, put a blank at the beginning of the formatting, i.e. “ %c %d%c...” If there is an open error, print a message and return to main. Read all data and save specified data in 1D integer arrays. Return the number of games read. If there is a file open error, the returned number of games counter will be zero. Use this information in main to determine if the program should be continued. If no games were read, print a message and do not continue the program.

```
void printSummary( char code[], int auRuns[], int oppRuns[], int innings[], int attend[],  
int numGames ) ;
```

Function uses the data in the 1D arrays and the number of games to print a summary report. Do not use a variable name for the minimum, mean, and maximum value of an integer array. Instead “nest” (or use) the corresponding function as the `printf` argument.

```
int getSecGames( char code[], int arrayAll[], int numGames, int arraySec[] );
```

Function uses the code array to find the SEC games. For each SEC game, store the runs in another 1D array. Return the number of SEC games. This function is used twice, once for the Auburn runs and once for the opponents’ runs in SEC games.

```
int extraInnings( int innings[], int numGames, int extra[] );
```

Function searches the innings array for values greater than the number of innings. The game number of each game with extra innings is stored in another 1D array. Return the number of games with extra innings.

Create data analysis functions to return the minimum, mean, and maximum value from an integer array. Data analysis functions are given in the lecture slides.

```
int intMax (int x[], int n);
```

```
int intMin (int x[], int n);
```

```
double intMean(int x[], int n);
```

Problem Constants:

```
FILENAME "2015_AU_softball.txt"  
MAXGAMES 50  
NUMSEC 25  
SECODE '*'  
NUMINNINGS 7
```

New commands:
1D integer arrays
indexing
function calling a function
nesting functions

Revisit:
casting

Problem Inputs:

See above.

Problem Outputs:

See above.

Other variables:

As needed.

Instructions:

- ☐ See Standards for Documentation of C Programs on the Resources page on Canvas.
- ☐ Insert comments at the top and throughout each file.
 - o Include the follow comments at the beginning of this (and ALL) files.
 - // submitter's name, **GROUP #** **Grade of ZERO for files with submitter name not part of Canvas group**
 - // other group members' names **Type "none" if submitting alone.**
 - // assignment number **Zero points for comments if no collaboration statement**
 - // date you completed the assignment
 - // **statement(s) about collaboration**
 - // a short narrative about what the file does
 - o Use the algorithm given as comments throughout your program.
- ☐ Use descriptive variable names.
- ☐ Use Sample Input/Output as a guide.
- ☐ Use **Generate CSD** to ensure correct indenting.
- ☐ Represent ALL given values as constants.

-5 points for absence of any of these required comments at the top at the top of each file.

If you do not submit individually, there will be a 5 POINTS PENALTY for not joining a group. Groups can be 2-4 students. DO NOT join a group unless you have worked with the other members. If you do, you will be removed from the group and given the grade of zero.

Sample Output:

```

2015 AU Softall Summary
           #games Min Mean Max
Runs scored-all    34     2  9.1 20
Runs allowed-all           0  2.4  8
Runs scored-SEC     6     4  8.2 14
Runs allowed-SEC           0  2.7  7
  
```

```

Games with extra innings:
14 23
  
```

Submit via Canvas:
